ORTHOPEDIC INSOLES

DGUV 112-191 (BGR 191)

ORTHOSTAT

With all orthopedic adaptation it has to be tested if the safety or occupational shoe still meets the requirements of the EN ISO 20345 or EN ISO 20347 standards. Together with the orthopedic specialist Doppler (www.doppler-online.com) we have developed the individually adaptable orthopedic insole ORTHOstat. By using this insole your shoes will remain certified according to EN ISO standard.

Our ESD styles are certified according to EN 61340-4-3 climate class 1 and EN 61340-5-1.

i

ESD ELECTROSTATIC DISCHARGE

Electrostatic Discharge (ESD) means the compensation of big differences in potential that causes high voltage pulses. This voltage pulse can cause damages or even destroy electronic components.

Potential differences often result from friction or contact and separation of items. By this a human can be charged up to 30.000 Volts. The electrostatic discharge can only be felt by a person from 2.000 Volt on as a small electric shock. However electrostatic sensitive devices can be harmed by a blocking voltage of 5 – 30 V. Therefore while working with electrostatic sensitive devices actions have to be taken to reduce electrical charges reliable and prevent the occurrence of quick discharge.

Actions against static discharge are described in the EN 61340-5-1 standard. An effective grounding of persons by using ESD footwear serves to protect sensitive devices by frequently discharging the human body.

ESD shoes are made to discharge the electrostatic charge through the ground to the earth potential. The resistance of the system Person-Shoe-Ground shall be below 35 MOhm according to EN 61340-5-1 (verification). The qualification of the ESD footwear according to EN 61340-4-3 is measured in relation to the climate class 1 (12% RH), 2 (25% RH) and 3 (50% RH).

According to EN 61340-4-3 the shoe is preconditioned adequately and measured filled with a defined quantity of metal balls on a metal plate. Here the resistance shall be below 100 MOhm.

In practice the discharge capacity of ESD footwear is not only highly depending on the climatic environment (humidity and temperature) but also on factors like contamination and condition of the flooring as well as the electrical resistance of the person's body. ESD representatives of a company have to check frequently if the implemented ESD products still work in a proper way. Where ESD footwear is worn the resistance of the flooring should not influence the functionality of the ESD shoes. The implementation of "walking tests" helps to validate the functionality of the system Person-Shoe-Flooring.

WARNING: : ESD shoes are not suitable for electricians or while working on sources with any electric voltage.

DEFINITION

ESD - Electrostatic Discharge

Electrostatic discharge is caused by an imbalance of potential on charged objects or people by contact or close proximity.

ESDS

Electrostatic Discharge Sensitive Device

EPA

Electrostatic Protected Area

Area where sensitive devices can be handled directly with minimum risk of electrostatic damage.

Electrostatic charge

Is produced by frictional contact and separation of two materials.

Resistance to ground (R_g) EN 61340

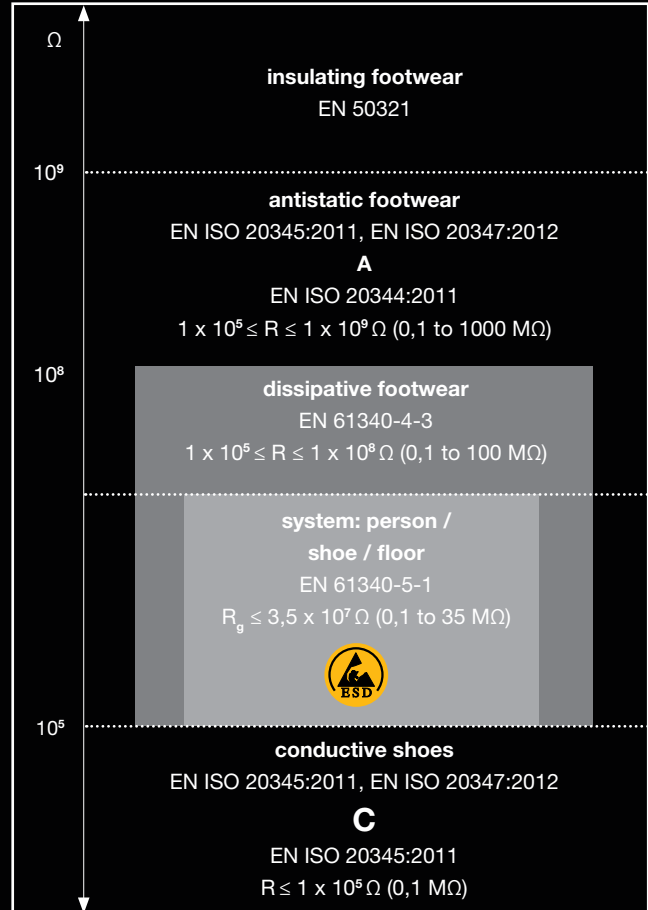

Is the resistance from a surface or an item within an EPA, measured with a suitable ohmmeter and test probe.

Latent damage

Is the damage caused by ESD to sensitive devices, which has the effect of reducing components reliability without causing immediate failure.

INFORMATION

Electrical resistance and protection against electrostatic phenomenons. ESD-footwear as primary grounding in the system of person/ shoe/ floor

A and C: additional requirements of occupational- and safety shoes regarding electric property. R: electrical resistance. R_g: ground resistance.

For the daily function testing of the shoes the use of test stations has been established. There the resistance of person and shoe is measured. Attention should be paid to the separate measuring of the feet.

Resistance Terminology

10 ³ Ohm =	0,001 MOhm =	1 kOhm
10 ⁴ Ohm =	0,01 MOhm =	10 kOhm
10 ⁵ Ohm =	0,1 MOhm =	100 kOhm
10 ⁶ Ohm =	1 MOhm =	1.000 kOhm
10 ⁷ Ohm =	10 MOhm	
10 ⁸ Ohm =	100 MOhm	
10 ⁹ Ohm =	1.000 MOhm =	1 GOhm
10 ¹⁰ Ohm =	10.000 MOhm =	10 GOhm
10 ¹¹ Ohm =	100.000 MOhm =	100 GOhm
10 ¹² Ohm =	1.000.000 MOhm =	1.000 GOhm

ESD SUSCEPTIBLE

The symbol has been used since 1984 and denotes components and subassemblies that are ESD susceptible.

ESD PROTECTIVE

The symbol was introduced in addition to symbol No. 1 in 1993 and denotes ESD protective products such as antistatic mats, trucks, clothing, protective covering, cartons, materials, etc.
